

Intelli - Agent-First Document Intelligence Platform

One-page repo summary (evidence-only)

WHAT IT IS

An agent-first platform for document intelligence, research workflows, and knowledge management.

Designed for trust: immutable artifacts/manifests, pointer-based versioning, and a run ledger.

WHO IT'S FOR

Enterprise analysts/researchers and the platform engineers supporting them, when outputs must be auditable and reproducible.

WHAT IT DOES

- Ingests files as immutable, content-addressed Artifacts (SHA-256) stored in object storage.
- Creates immutable Manifests (tree snapshots) and advances Git-like Pointers (mutable HEADs).
- Records executions as Runs with an append-only RunEvent ledger (steps, tool calls, retrieval).
- Exposes substrate + run operations via FastAPI HTTP API and via MCP tools for agent clients.
- Supports demo-grade RAG workflows (index + ask endpoints) with pluggable search backends.
- Ships a Vite-based product UI in 'ui/' (repo also has an older/experimental UI at root).

HOW IT WORKS (repo-based)

- UI ('ui/') and MCP/HTTP clients call the FastAPI API server ('src/intelli/main.py').
- Dev infra uses Postgres (pgvector), MinIO (S3), and OpenSearch (see 'docker-compose.yml').
- Metadata in Postgres via SQLAlchemy models ('src/intelli/db/models/*'; migrations in 'migrations/').
- Artifact bytes live in S3-compatible storage (MinIO) or local FS ('src/intelli/storage/').
- Indexing backend: 'pgvector' (default) or OpenSearch chunk index ('services/indexing/*', 'docs/INDEX_CONTRACT.md').
- LangGraph checkpoints persist to Postgres ('src/intelli/db/checkpointer.py'; initialized on app startup).

HOW TO RUN (minimal)

- Prereqs: Python >=3.12, Docker + Compose, Node >=18 + npm (see 'pyproject.toml').
- Interactive dev (API + UI): 'bash scripts/dev/run.sh'.
- Validated startup + smoke tests: 'bash scripts/dev/validate.sh'.
- Scripts create '.env' from '.env.example'; set 'DEBUG=true' and (optional) 'OPENAI_API_KEY' for RAG.
- Defaults: API http://localhost:8000 (docs: /docs), UI http://localhost:3000.

Evidence: README.md, docs/START_HERE.md, docs/STARTUP_SEQUENCE.md, docker-compose.yml, src/intelli/*
